

PROJECT DEMONSTRATION PHASE

Incident Life Cycle Automation in ServiceNow

1. Project Objective

The main objective of this project is to automate and streamline the complete incident life cycle in ServiceNow, from incident creation to resolution and closure.

2. Project Demonstration

The demonstration begins by creating an incident and entering important details such as caller, category, description, impact, urgency and priority.

The incident is then assigned to the appropriate support group or user. The team can investigate the issue, update the incident status, and add work notes and additional information.

The demonstration shows how the incident moves through its life cycle, including assignment, investigation, resolution and final closure.

3. Key Features Demonstrated

- Incident creation and record management
- Categorization and priority handling
- Assignment to support groups/users
- Status and progress tracking
- Work notes and activity updates
- Resolution and closure
- Automation and notifications where configured

4. Workflow

Incident Creation → Categorization → Priority → Assignment → Investigation → Resolution → Closure

5. Final Outcome

The project demonstrates a structured and efficient approach to incident management. Automation reduces manual effort, improves tracking and visibility, and helps support teams handle incidents consistently and efficiently.

6. Submission Demonstration

The project documentation and explanation video are prepared for submission. The GitHub repository and Demo Link should be checked to ensure that all submitted links are correct and working before final SkillWallet submission.
